Java: overview by example
Bank Account

A Bank Account

- maintain a balance (in CHF) of the total amount of money
  - balance can go negative
- can open an account with an initial sum of money
- can deposit money on the account
  - deposit possible only for a nonnegative amount of money
- can withdraw money from the account
  - withdraw possible only for a nonnegative amount of money

Java implementation: BankAccount class

```java
public class BankAccount {
    ...

    }
```
Attribute **balance**

- maintain a balance (in CHF) of the total amount of money

```java
public class BankAccount {

    // Attribute 'balance' inaccessible by clients
    private int balance;

    // Public getter for 'balance'
    public int getBalance() { return balance; }

    // Restricted setter for 'balance'
    protected void setBalance(int balance){
        this.balance = balance;
    }

    ...
}
```
Constructor: open a new account

- can open an account with an initial sum of money

```java
public class BankAccount {
    ...

    // no-args constructor
    public BankAccount() { balance = 0; }

    // 1-arg constructor
    public BankAccount(int initialBalance) { 
        if (initialBalance >= 0) {
            balance = initialBalance;
        }
        else throw new BankAccountException("...");
    }
}
```
Method **deposit**

- can deposit money on the account
  - deposit possible only for a nonnegative amount of money

```java
public class BankAccount {
    ...
    // deposit 'amount'
    // don't do anything if 'amount' < 0
    public void deposit(int amount) {
        if (amount >= 0) {
            balance = balance + amount;
        }
    }
    ...
}
```
**Method withdraw**

- can withdraw money on the account
  - withdraw is effective only for a nonnegative amount of money.

```java
public class BankAccount {
    ...
    // withdraw allowed 'amount'
    // access restricted only to some clients
    protected int withdraw(int amount) {
        if (amount >= 0) {
            balance = balance - amount;
            return 0;
        }
        else { return -1; }
    }
    ...
}
```
Premium Bank Account

A special Bank Account:

- basic functionalities as in a regular Bank Account
- has a minimum balance and a fixed fee
- if the balance goes below the minimum balance, the fee is automatically deducted from the balance
  - example:
    - minimum balance = 200, fee = 15
    - if a withdrawal brings the balance down to 150, an additional 15 is deducted, so the final balance after the deposit is 135

Java implementation:

```java
PremiumBankAccount class inheriting from BankAccount

public class PremiumBankAccount
    extends BankAccount {

    ...

}
```
New attributes

- has a minimum balance and a fee

```java
public class PremiumBankAccount extends BankAccount {

    public final int minimumBalance = 200;

    public final int lowBalanceFee = 15;

    ...
}
```
public class PremiumBankAccount extends BankAccount {

    // constructor
    public PremiumBankAccount(int initialBalance) {
        if (initialBalance >= minimumBalance) {
            setBalance(initialBalance);
        } else {
            throw new PremiumBankAccountException("...");
        }
    }

    ...
}

New constructor
Redefining withdraw

- if the balance goes below the minimum balance, the fee is automatically deducted from the balance

```java
public class PremiumBankAccount extends BankAccount {
    ...
    // overrides corresponding method in BankAccount

    protected int withdraw(int amount) {
        int res = super.withdraw(amount);
        if (res == 0 && getBalance() < minimumBalance) {
            setBalance(getBalance() - lowBalanceFee);
            return 0;
        } else {
            if (res == -1) {
                return -1;
            } else {
                return 0;
            }
        }
    }
}
```
Clients of the BankAccount Class

- A client class which runs two instances of BankAccount

```java
public class BankClient {

    public static void main(String[] args) {
        BankAccount ba = new BankAccount();
        BankAccount pba = new PremiumBankAccount(250);
        System.out.println(ba.getBalance());
        System.out.println(pba.getBalance());
        ba.deposit(1800);
        pba.withdraw(100);
        System.out.println(ba.getBalance());
        System.out.println(bap.getBalance());
    }
}
```
Running a Java application

> javac BankAccount.java
    PremiumBankAccount.java
    BankClient.java

> java BankClient

0
250
1800
135
