# Overview of EiffelStudio

---

- EiffelStudio by numbers
- General overview
- Compiler
  - Validation
  - Code generation
- User interface – EiffelStudio
- Repository
- Runtime
- Projects
- Q&A

# A few numbers

---

- Command-line compiler only:
  - 2100 classes (460 for libraries)
  - 440 000 lines of code (120 000 for libraries)
- Full graphical IDE:
  - 4200 classes (1100 for libraries)
  - 980 000 lines of code (280 000 for libraries)
- C code:
  - 100 000 lines of code

- EiffelStudio is made of four parts:
  - Core libraries (EiffelBase, EiffelVision2, Gobo...)
  - Core compiler
  - Command line interface
  - Graphical interface
- The graphical IDE contains the command line compiler.
- Command-line compiler can be compiled stand-alone.

# Overview 2 - Compilation process

---

- More at [http://eiffelsoftware.origo.ethz.ch/index.php/Eiffel\\_Compilation\\_Explained](http://eiffelsoftware.origo.ethz.ch/index.php/Eiffel_Compilation_Explained)
- Degree 6: finding classes
- Degree 5: parsing classes
- Degree 4: inheritance analysis
- Degree 3: type checking

## Overview 2 – Compilation process (2)

---

- Degree 2/1: melting
- Degree -1: freezing
- Degree -2,-3: finalization
  - Degree -2: process polymorphism
  - DCR: Dead Code Removal
  - Degree -3: code generation

- All classes representing *AST* nodes are descendants of *AST\_EIFFEL* and have the *\_AS* suffix.
- Parser written using gelex/geyacc.
- Parser has many faces:
  - Syntax checker: no AST, useful for syntax validation.
  - Light parser: keeps only nodes needed for validation.
  - Full parser (aka roundtrip parser): preserves all information about Eiffel text (code, blanks and comments).

- Every class has an associated *CLASS\_I* instance.
- *CLASS\_I* stores information about the file holding the class text: modification date, class name, associated cluster.
- Classes that are part of the system also have an associated *CLASS\_C* instance.
- *CLASS\_C* stores relations between classes as well as its features.

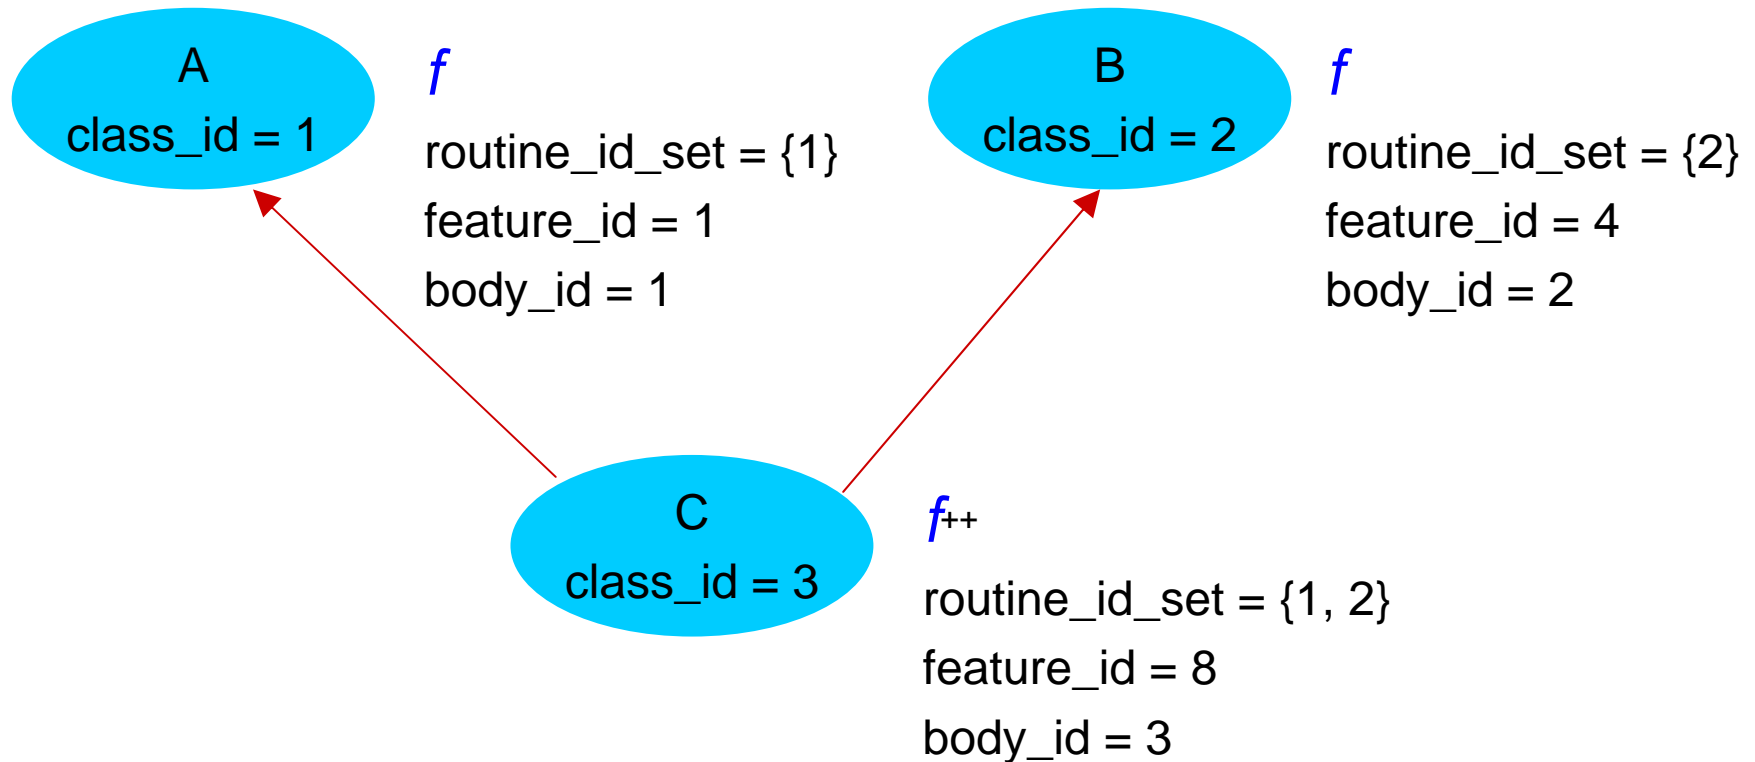

- All types appearing in an AST are transformed into instances of *TYPE\_A*.
- *TYPE\_A* descendants:
  - *CL\_TYPE\_A*
  - *GEN\_TYPE\_A*
  - *TUPLE\_TYPE\_A*
  - *LIKE\_FEATURE*
  - *FORMAL\_A*
  - ...

- The features of a class are stored in *CLASS\_C* into an instance of *FEATURE\_TABLE*.
- A *FEATURE\_TABLE* is a container of *FEATURE\_I*, indexed by feature names and, for fast lookup, by “routine IDs”.
- Descendants of *FEATURE\_I*:
  - *PROCEDURE\_I*
  - *DYN\_FUN\_I*
  - *ATTRIBUTE\_I*
  - *EXTERNAL\_I*
  - ...

- Class ID: identifier given to each class.
- Routine ID: identifier given to each feature globally for polymorphism
- Feature ID: identifier given to each feature within a class
- Body ID (aka Body Index): identifier given to a feature text

- At degree 3 each feature is transformed into a *BYTE\_CODE* instance, a tree of *BYTE\_NODES*.
- Different types of code generation:
  - Melting
  - Freezing
  - Finalization
  - .NET freezing
  - .NET finalizing
  - Java freezing
  - Java finalizing

# Dynamic dispatch

---

- Based on routine IDs
- Each routine ID is associated with a virtual table indexed by the dynamic type of an object at runtime.
- Generated code looks like:  
    `a.f (args) ⇔ routine [dynamic_type (a)] (args)`

- Designed as a library.
- Configured by EiffelStudio to add:
  - Code completion
  - Pick and drop
  - Syntax highlighting
- Used for displaying code, but also results of formatters (views: flat, contract, interface...)
- *TEXT\_PANEL* is the ancestor to all editors

- Controlled by *EB\_CONTEXT\_TOOL*
- Information outputs:
  - Compilation global process, system information
  - Errors
  - Warnings
  - C compiler output
- Executing commands from EiffelStudio: svn status, svn update, svn commit...

- Uses graph library as data structure for internal representation:
  - Inherits from *EG\_NODE*
  - Supports “physics” (force directed layout)
- Drawing done using model cluster of EiffelVision2 (*EV\_MODEL\_WORLD*)
- Two models are supported:
  - BON (*BON\_CLASS\_DIAGRAM*)
  - UML (UML subset, *UML\_CLASS\_DIAGRAM*)

- Unification of classes/features/metrics facilities through a query language
- Grammar not fully specified yet
- What we have in mind: something like

```
select classes  
from cluster=base  
where count(features) > 10
```
- Work still in progress

- New search facility (*EB\_SEARCH\_TOOL*):
  - Multiple scope: class, cluster, multiple clusters, system
  - Regular expression support
  - Search bar add-on to all editors
- Clusters and classes: *EB\_CLUSTER\_TOOL* and *EB\_CLASSES\_TREE*
- Features tree: *EB\_FEATURES\_TOOL* and *EB\_FEATURES\_TREE*

- Pebbles used for Pick and Drop are descendants of *STONE*: *CLASSI\_STONE*, *CLASSC\_STONE*, ...
- Communication between all graphical elements is done through a stone (instance of *STONE*)

- *STONE* descendants:
  - *CLASSI\_STONE*: non-compiled class
  - *CLASSC\_STONE*: compiled class
  - *CLUSTER\_STONE*: cluster/group/library/assembly
  - *FEATURE\_STONE*: feature in context of a class
  - *ERROR\_STONE*: compilation error
  - *OBJECT\_STONE*: object in debugger
  - ...

- Locate a class or feature through an instance of *EB\_ADDRESS\_MANAGER*
- Used under two forms:
  - As toolbar
  - As modal dialog from context tool
- But same semantics

- *EB\_DEVELOPMENT\_WINDOW*
  - Top level window in EiffelStudio
  - Handles all tools (clusters, features, context tool, editor, search,...) and their layout
  - Handles tool synchronization through stones
  - Handles creation of menus and commands
  - Two state: developing or debugging

- Under trunk you have:
  - Delivery:
    - Files used to build a complete installation of EiffelStudio
    - Scripts to build a complete installation of EiffelStudio
  - Src
  - free\_add\_ons: contributions made outside EiffelSoftware used by or distributed with EiffelStudio

- Under Src:
  - C\_library: libpng, zlib
  - bench: EiffelStudio source code and runtime
  - build2: EiffelBuild source code
  - com\_wizard: EiffelCOM Wizard source code
  - common: parsers and AST classes
  - dotnet: .NET specific tools for importing .NET assemblies
  - examples: examples included in EiffelStudio delivery
  - help: source code of wizards for project creation
  - library:
  - library.net:
  - tools: various tool useful for developing

- Source code for building doc\_builder is at trunk/Src/tools/doc\_builder
- Documentation is written in XML and then converted to HTML using doc\_builder
- For more details read:

<http://eiffelsoftware.origo.ethz.ch/index.php/Documentation>

- Handles:
  - Memory management and garbage collection
  - Equality and copy
  - Generic conformance
  - Object traversal
  - Debugging facilities for EiffelStudio
  - Threading

# Runtime binaries

---

- Runtime: C/run-time/lib[mt][ebench|wkbench|finalized].[a|so]
- Estudio: C/ipc/deamon/estudio
- Helper for incremental objects storing in compiler:  
C/compiler/lib[mt][w]compiler.a
- Helper for debugging: C/ipc/ewb/lib[mt][w]ewb.a
- Helper for launching C compilation: C/platform/libplatform.a

- Best contributions will be integrated to EiffelStudio
- What are “best” contributions?
  - Useful for all/most Eiffel programmers
  - Working
  - Clean
  - Documented
  - Elegant design
  - Contracted
- Prize for TEETH 2006 (Top EiffelStudio ETH contribution)!

# Already in the works for 5.7

---

- Tabbed editor
- Fully customizable layout
- New interface for editing project configurations
- Query language
- Contextual menus instead of pick and drop

- Code completion:
  - Add stub routines for inherited deferred routines
  - Add preconditions to a routine by analyzing preconditions of routines used
  - Add predefined code snippet
- Add new type of refactoring
- New wizards to create classes (e.g. if it is a Vision2 window, then add vision2 library automatically to project configuration)

# More potential good projects!

---

- Tooltip in editor for both showing routines contract and attribute/local/argument value when debugging
- Redo error and warning reporting
- Detect syntax and semantics errors while typing
- Auto-correction facilities
- Integrate EiffelBuild into EiffelStudio

# More!

---

# Q&A

---

Any questions?

Thanks and happy Eiffeling!
