

Einführung in die Programmierung Introduction to Programming

Prof. Dr. Bertrand Meyer

Exercise Session 7

News (Reminder)

Mock exam next week!

- You have to be present
- The week after we will discuss the results
- Assignment 7 due on November 14

Today

- Inheritance
- Genericity

Principle:

Describe a new class as extension or specialization of an existing class
(or several with *multiple* inheritance)

If B inherits from A :

- As **modules**: all the services of A are available in B
(possibly with a different implementation)
- As **types**: whenever an instance of A is required, an instance of B will be acceptable
("is-a" relationship)

Let's play Lego!

Class *BRICK*

deferred class
BRICK

feature

width: INTEGER

depth: INTEGER

height: INTEGER

color: COLOR

volume: INTEGER

deferred

end

end

Class *LEGO_BRICK*

Inherit all features of class *BRICK*.

```
class  
  LEGO_BRICK
```

```
  inherit  
    BRICK
```

New feature, number of nubs

```
  feature  
    number_of_nubs: INTEGER
```

Implementation of *volume*.

```
    volume: INTEGER  
    do  
      Result := ...  
    end  
  end
```

Class *LEGO_BRICK_SLANTED*

```
class  
  LEGO_BRICK_SLANTED
```

```
  inherit  
    LEGO_BRICK
```

```
    redefine  
      volume  
    end
```

```
  feature  
    volume: INTEGER  
    do  
      Result := ...  
    end
```

```
end
```

The feature *volume* is going to be redefined (=changed). The feature *volume* comes from *LEGO_BRICK*

Class *LEGO_BRICK_WITH_HOLE*

```
class  
  LEGO_BRICK_WITH_HOLE
```

```
  inherit  
    LEGO_BRICK
```

```
    redefine  
      volume  
    end
```

```
  feature  
    volume: INTEGER  
    do  
      Result := ...  
    end
```

```
end
```

The feature *volume* is going to be redefined (=changed). The feature *volume* comes from *LEGO_BRICK*

Inheritance Notation

Notation:

Deferred *

Effective +

Redefinition ++

- Deferred
 - Deferred classes can have deferred features.
 - A class with at least one deferred feature must be declared as deferred.
 - A deferred feature does not have an implementation yet.
 - Deferred classes cannot be instantiated and hence cannot contain a create clause.

Can we have a deferred class with no deferred features?

- Effective
 - Effective classes do not have deferred features (the "standard case").
 - Effective routines have an implementation of their feature body.

- If a feature was redefined, but you still wish to call the old one, use the **Precursor** keyword.

```
volume: INTEGER  
do  
    Result := Precursor - ...  
end
```

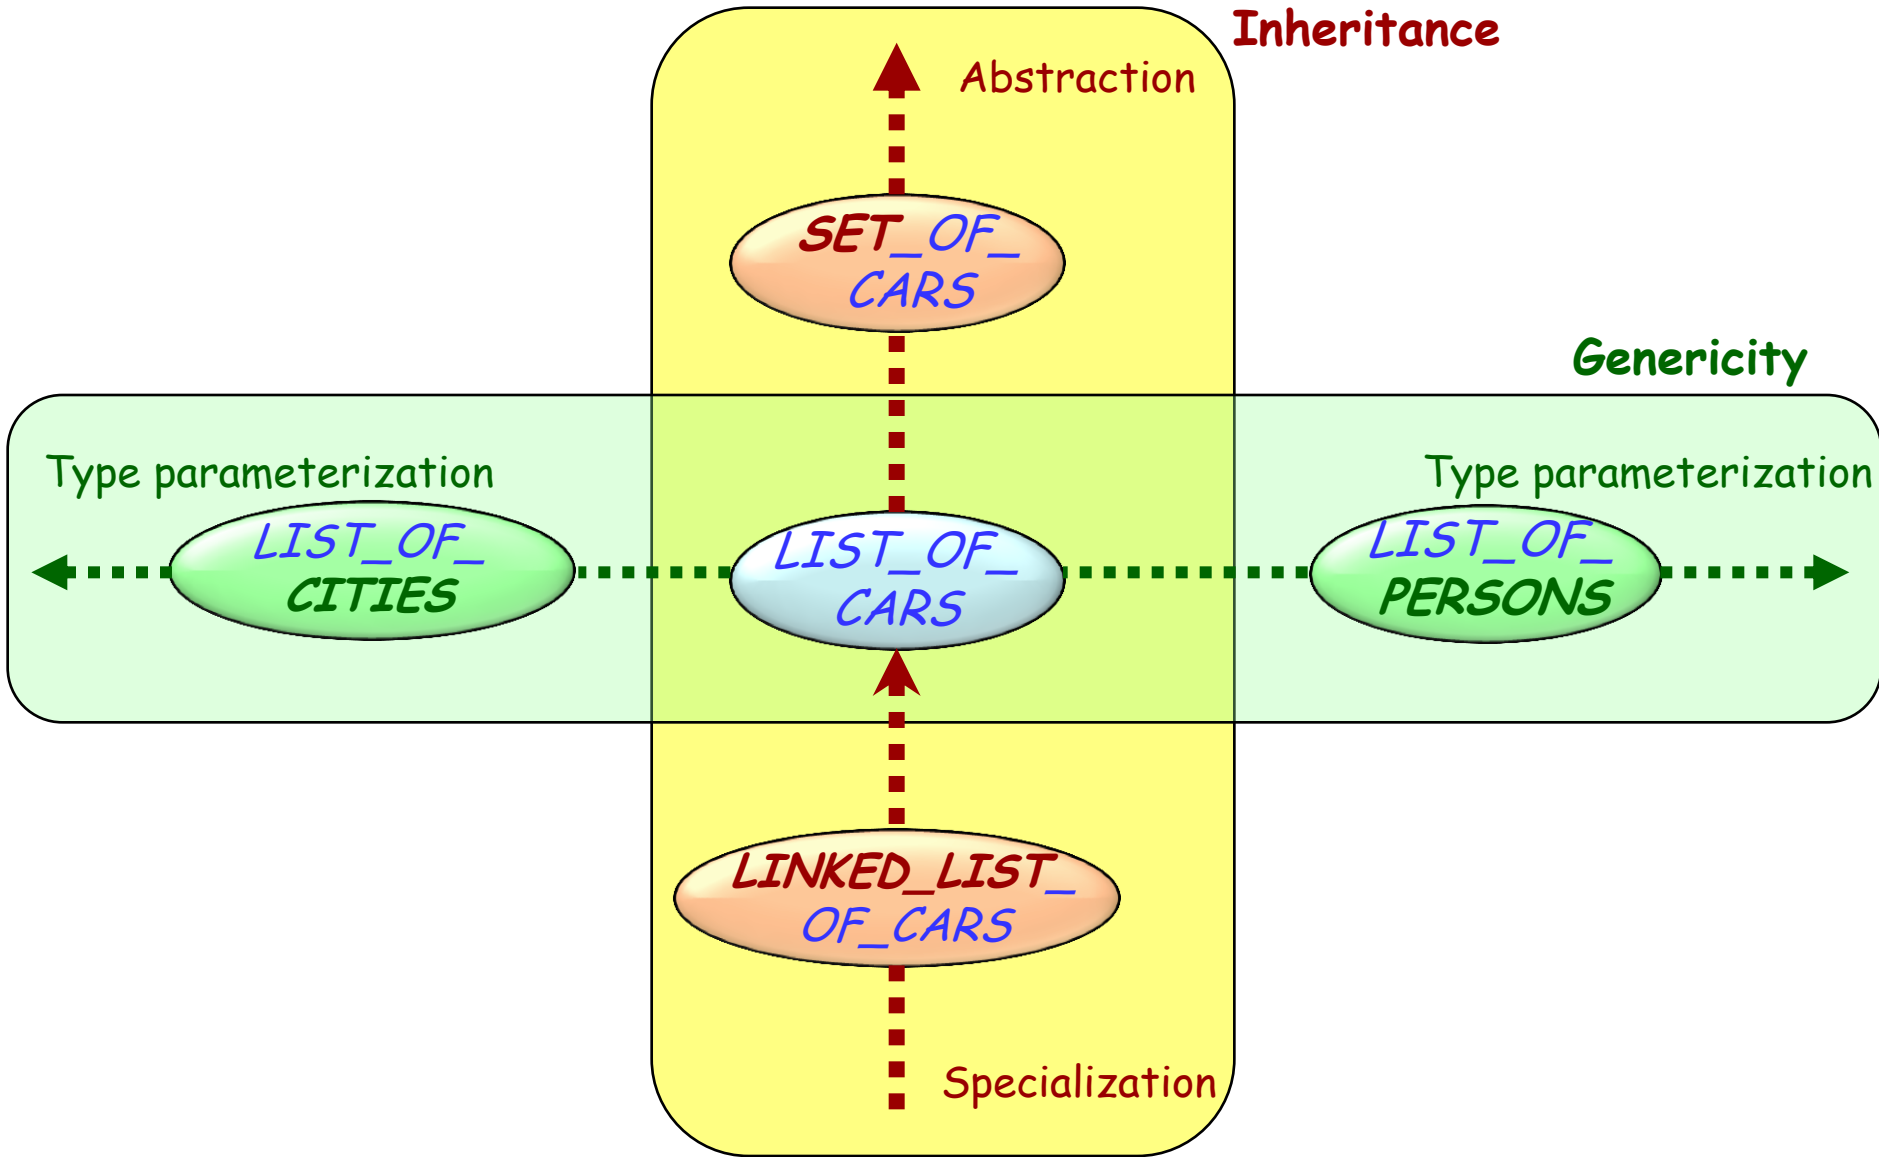

Today

- Inheritance
- Genericity

- Genericity lets you parameterize a class. The parameters are types. A single class text may be reused for many different types.

A generic list

Formal generic parameter

```
class LIST [G] feature  
  extend (x : G) ...  
  last : G ...  
end
```

To use the class: obtain a **generic derivation**, e.g.

Actual generic parameter

```
cities : LIST [CITY]
```

A generic list with constraints

class

STORAGE [G] > RESOURCE

inherit

LIST [G]

constrained generic parameter

feature

consume_all

do

from *start* **until** *after*

loop

item.consume

forth

end

end

end

The feature *item* is of type *G*. We cannot assume *consume*.

assume this.

- Using genericity you can provide an implementation of type safe containers.

x: ANIMAL

animal_list: LINKED_LIST[ANIMAL]

a_rock: MINERAL

animal_list.put(a_rock) -- Does this rock?

Definition: Type

We use types to declare entities, as in

x: SOME_TYPE

With the mechanisms defined so far, a type is one of:

- A non-generic class e.g. *METRO_STATION*
- A **generic derivation**, i.e. the name of a class followed by a list of **types**, the **actual generic parameters**, in brackets (also recursive)
e.g. *LIST[ARRAY[METRO_STATION]]*
LIST[LIST[CITY]]
TABLE[STRING, INTEGER]

So, how many types can I possibly get?

Two answers, depending on what we are talking about:

➤ Static types

Static types are the types that we use while writing Eiffel code to declare types for entities (arguments, locals, return values)

➤ Dynamic types

Dynamic types on the other hand are created at run-time. Whenever a new object is created, it gets assigned to be of some type.

class *EMPLOYEE*

feature

name: STRING

birthday: DATE

end

class *DEPARTMENT*

feature

staff: LIST[EMPLOYEE]

end

bound by the program text:

EMPLOYEE

STRING

DATE

DEPARTMENT

LIST[G]

becomes LIST[EMPLOYEE]

Object creation, static and dynamic types

```
class TEST_DYNAMIC_CREATION
feature
  ref_a: A; ref_b: B
  -- Suppose B, with creation feature make_b,
  -- inherits from A, with creation feature make_a

  do_something
  do
    create ref_a.make_a
      -- Static and dynamic type is A

    create {B} ref_a.make_b
      -- Static type is A, dynamic type is B

    create ref_b.make_b
    ref_a := ref_b
  end
end
```

Dynamic types: another example

```
class SET[G] feature
  powerset: SET[SET[G]] is
  do
    create Result
    -- More computation...
  end

  i_th_power(i: INTEGER): SET[ANY]
  require i >= 0
  local n: INTEGER
  do
    Result := Current
    from n := 1 until n > i loop
      Result := Result.powerset
      n := n + 1
    end
  end
end
end
```

Dynamic types from *i_th_power*:

SET[ANY]

SET[SET[ANY]]

SET[SET[SET[ANY]]]

...
