 - and many others

Design by contract

Contracts

```
LINKED_LIST . index_of (v: G; i: INTEGER_32): INTEGER_32
-- Index of `i'-th occurrence of item identical to `v'.
-- 0 if none.

require

positive_occurrences: i > 0
ensure

non_negative_result: Result >= 0
```

Applications

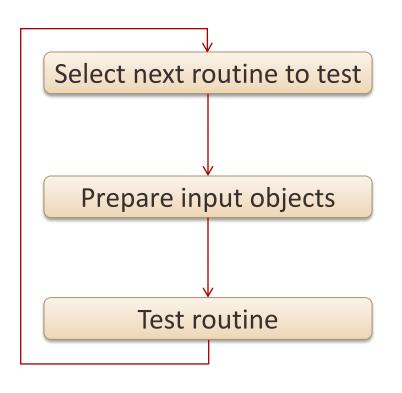

- Specification
- Documentation
- Testing & fixing

Automatic (random) testing

- Testing
 - Input
 - Oracle

- * AutoTest: Automatic testing programs with contracts
 - Precondition of the routine under test as the valid input filter
 - Postcondition of the routine as the oracle

The select-prepare-test loop

Sample testing process

create {LINKED_LIST [INTEGER]} v1.make

v2 := 1

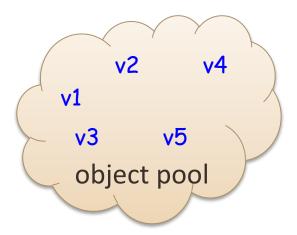

v1.extend (v2)

v1.wipe_out

v3 := 125

v4 := v1.has(v3)

v5 := v1.count

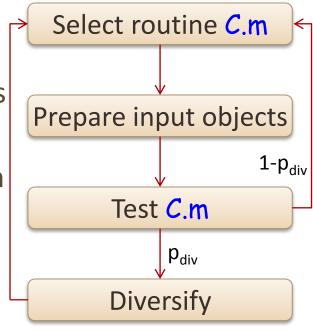

Performance evaluation

- Testing results
 - Precondition of the routine-under-test is violated
 - Invalid test case
 - Precondition of the routine-under-test is satisfied
 - Postcondition satisfied
 - Passing test case
 - Postcondition not established
 - Failing test case (detected fault)
- Evaluation criteria
 - * Fault detection rate
 - Input space coverage

Random⁺ testing

Essentials

- Input generation
 - Primitive types: random selection + boundary values
 - Reference types: constructor calls + random selection
- Diversification
 - With probability p_{div} after each test

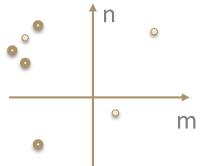

Result

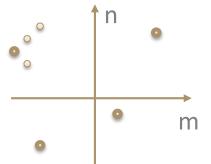

- Find faults in widely used, industrial-grade code
- High fault detection rate in the first a few minutes

Adaptive Random Testing

Essentials

- Maintain a list of objects O used in testing a routine r
- Select the object with the highest average <u>distance</u> to O for the next test of r

Result

 Takes less time and generated tests, on average by a factor of 5, to the first fault

Testing with guided object selection

Essentials

LINKED_LIST . remove_right (cursor: CURSOR)

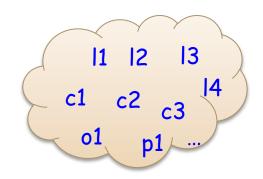

- Keep track of preconditionsatisfying objects
- Use them with higher probability

v-pool

Results

- 56% of the routines that cannot be tested before are now tested
- 10% more faults detected in the same time
- Routines tested 3.6 times more often

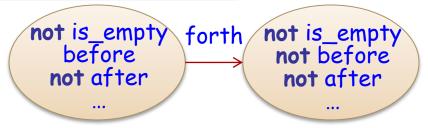

object pool

Stateful testing

- Essentials
 - Object states in Boolean expressions

```
LINKED_LIST. index_of (v: like item; i: INTEGER_32): INTEGER_32
```

- before, after, is_empty, i > 0, ...
- Infer preconditions from existing tests
 - Boolean expressions that always hold as preconditions
- Prepare inputs violating the inferred preconditions
 - Select objects in the object pool
 - Transit objects using <u>object behavioral model</u>
- Result
 - 68% more faults detected
 with 7% time overhead

Summary

- Contracts promote automatic testing
 - AutoTest
 - Preconditions as input filters and postconditions as oracles
